

Grumman-Bethpage:

05/09/95

On May 9, 1995, I spoke with John Barnes of NYSDEC, regarding NYSDEC's Remediation Division's work on the Grumman-operated portion of the facility. The work being done at the Grumman-operated portion is being performed under a State Superfund Order, and consequently Superfund terminology is being used for each of the stages of the remedial process (i.e. "FS" instead of "CMS"). John Barnes told me that a FS was not completed for either of the two source areas which require remediation; These areas are the "Plant 2 Spill Area" and "Plant 15". For the Plant 2 Spill Area, an interim remedial measure is being done which most likely will be the final measure. Plant 15, the remedial investigation is ongoing, and it is expected that there will be only interim measures required. A no further action (NFA) ROD was signed in late March, which says that aside for the interim measures discussed above, there is no further action required regarding the onsite source contamination. John Barnes will be bringing me a copy of the ROD when he visits the EPA Superfund Program tomorrow.

A separate FS for groundwater is currently underway, but has not been completed.
